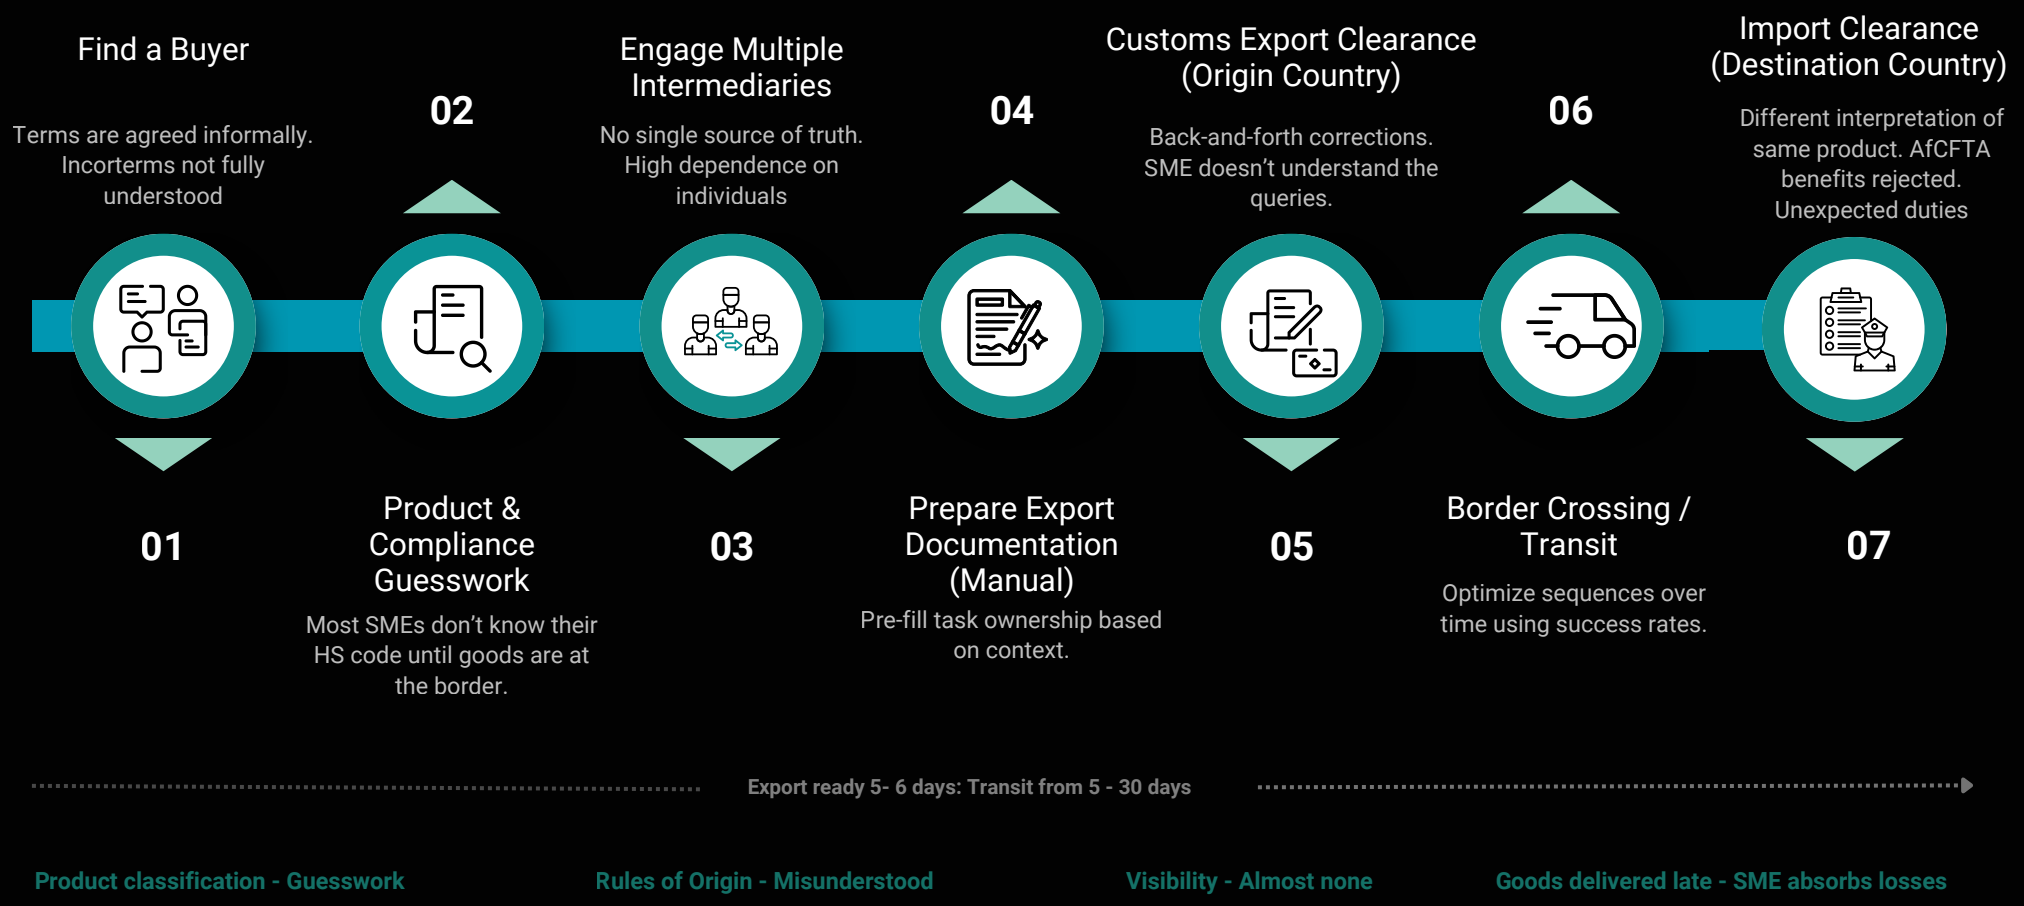
Building the Digital Infrastructure for Africa's $3.4T Single Market.

movu

A typical SME export journey



movu

The Problem

Trade in Africa is structurally broken — not because of lack of demand, but because software doesn't exist. **This is not a marketplace problem. It's a systems problem.**

Africa trades less internally than any other region.

The problem isn't logistics — it's rules, compliance, and fragmented systems.

AfCFTA exists, but execution fails at borders.

SMEs rely on human intermediaries, WhatsApp, and guesswork.

movu

The Solution

Movu is the TaaS (Trade-as-a-Service) **orchestration layer for the AfCFTA era**. SMEs export through a fragmented process that only works for insiders and Enterprise level exporters. Movu gives SMEs confidence to export — by turning complex trade rules into simple, guided workflows.

01 Easy to use
Mobile first - easy to use. Creating export ready shipments documents as easy as sending a WhatsApp

02 One workflow
One workflow for compliance, logistics and finance

03 Post-Shipment Intelligence
Border Feedback & Learning Loop. Here's what happened at the border — and how to do better next time

Compliance first 04
A pre-compliance layer before customs systems

Access to finance 05
Improved access to trade finance, payments and insurance

Export Readiness Check 06
Validates product rules, required documents & country specific requirements in under 5 mins

movu

The Solution

Movu is a trade intelligence system & execution engine - formalising informal trade knowledge into executable logic. Making exporting across Africa as simple as sending a WhatsApp message — **without compromising compliance.**

Tell us what you're exporting. & to where - Movu figures out the rest.

Guided Export Workflow. Do this → then this → then this.

Access to Finance, Insurance & Logistics.

Executable trade rules engine - the defacto interpreter of African trade rules

Movu is the TaaS (Trade-as-a-Service) orchestration layer for the AfCFTA era.

Export ready within an hour

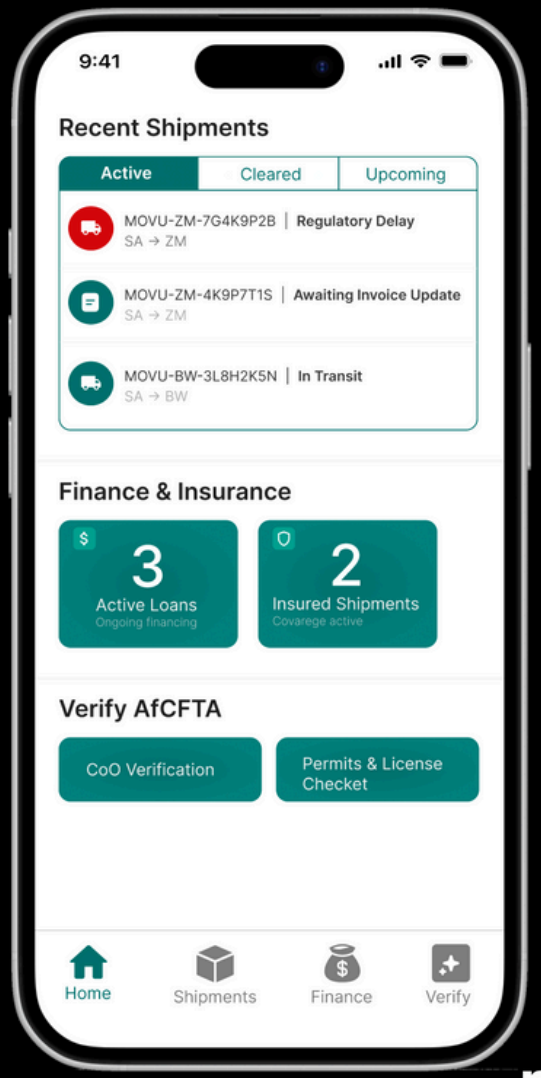
movu

The Solution

Movu is:

- Not a bank **X**
- Not a customs system **X**
- Not a freight forwarder **X**

Movu is an AI-powered Trade-as-a-Service platform that **digitises** customs compliance, certificates of origin, export & import permits, financing readiness, and cross-border logistics — in one workflow

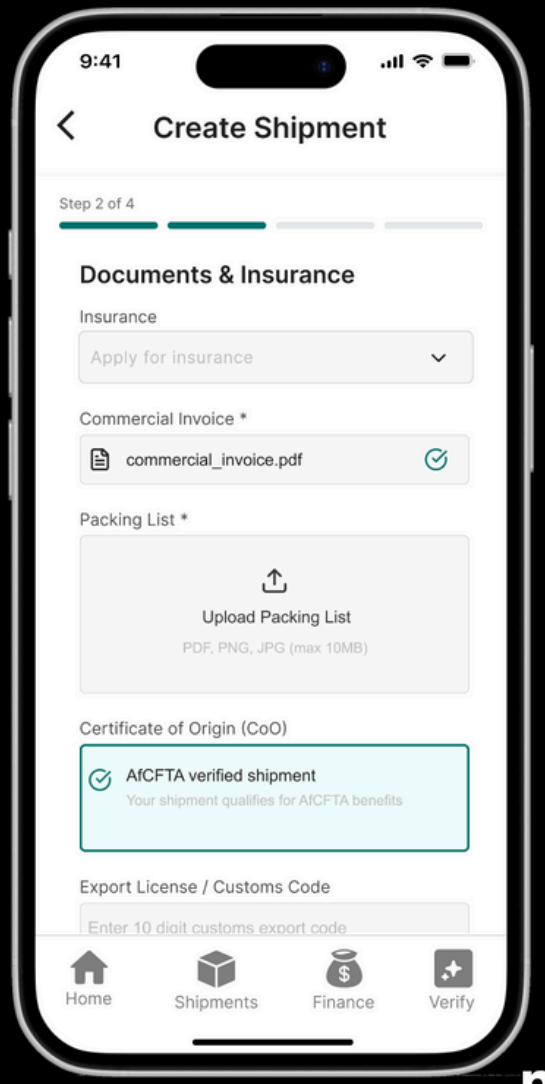


movu

The Solution

Value Proposition: Exporters

- Reduced cost and time to export
- Clear guidance on **AfCFTA eligibility** and **compliance**
- Automated document generation and validation
- Improved access to trade finance and insurance
- **Confidence to scale** across African corridors

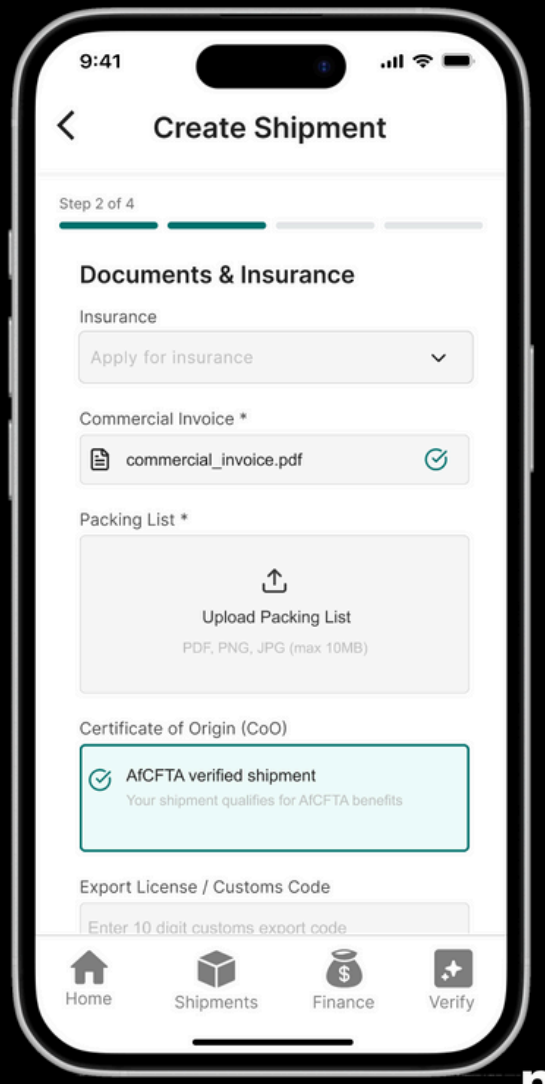


movu

The Solution

Value Proposition: Regulators

- Improved **data quality** and standardisation
- Lower post-clearance audit risk
- Enhanced traceability and **origin verification**
- Support for digitisation and single-window initiatives
- Increased formalisation of SME trade flows



movu

The Technical Moat

01 Rules of Origin (RoO) Engine

We are building a deterministic, versioned rules engine that translates AfCFTA Rules of Origin and corridor-specific trade requirements into executable, explainable logic.

02 AI-Assisted Compliance Structuring

AI system that converts informal SME inputs and paper documents into structured, compliance-grade data, reviewed and approved by deterministic systems.

03 Workflow Orchestration Across Institutions

A state-machine–driven orchestration layer that coordinates exporters, agents, customs, logistics providers, and financiers through a single executable workflow.

04 Event-Driven Risk & Finance Enablement

Simplifies complex compliance information in to into clear, simple signals that financiers and exporters can easily understand and use to make financial decisions.

movu

The Technical Moat

01 Rules of Origin (RoO) Engine

- Trade rules are ambiguous, inconsistent, and frequently updated
- Enforcement varies by country, port, and even officer

This logic currently lives in people's heads. Movu turns it into software.

02 AI-Assisted Compliance Structuring

- SMEs describe products inconsistently
- Documents differ by country and corridor
- AI must assist without becoming the system of record

The moat is human-in-the-loop AI feeding a strict rules engine, not black-box automation.

03 Workflow Orchestration Across Institutions

- No shared source of truth across stakeholders
- Each party works in different systems
- Errors propagate silently until the border

Movu owns the sequence, validation, and correction loop — not just data storage.

04 Event-Driven Risk & Finance Enablement

- Banks don't trust documents — they trust processes
- Risk lives in missing context, not missing files

Movu becomes the trust translation layer between trade execution and finance.

movu

System Architecture

01 SME Input Layer

Exporters describe what they are shipping, where it is going, and under what terms — often informally and inconsistently.

02 AI Structuring Layer

AI assists by converting messy inputs and documents into structured, reviewable trade data — without becoming the system of record.

03 Deterministic Rules Engine

A versioned Rules of Origin and trade-logic engine that evaluates HS classification, AfCFTA eligibility, and corridor-specific requirements with explainable outcomes.

04 Workflow Orchestration Layer

A state-machine–driven engine sequences tasks across exporters, agents, customs, logistics providers, and financiers — enforcing order, validation, and correction.

05 Integration Layer

Movu to exchange structured data with customs systems, logistics platforms, and financial institutions through APIs and adapters.

06 Border Outcome Feedback Loop

Actual border decisions feed back into the system, improving rule confidence, risk scoring, and future recommendations.

movu

What We Build First

The goal of Phase 1 is not scale - but to prove that executable trade logic and orchestration materially **reduce failures** at the border.

High-Frequency SME Product Categories

Border Outcome Capture & Learning Loop

Initial high-volume corridor(s)
(South Africa - Zambia)

- Export Compliance & Rules of Origin.
- Rules of Origin logic for AfCFTA-eligible goods moving from South Africa to Zambia.
- Export-side compliance checks only

Export Readiness & Pre-Border Validation Engine

A fast "export readiness check" that validates:

- HS code confidence
- AfCFTA eligibility
- required documents for SA → ZM
- Clear pass / risk / fail outcomes before shipment moves.

Guided Workflow for Exporters

A step-by-step export workflow for SMEs:

- what to do
- when to do it
- who is responsible

movu

24-Month North Star

Movu is a secure, reliable, and explainable trade execution platform that works in real African conditions and is trusted across the entire trade ecosystem

Human-in-the-Loop AI Is Embedded & Fully Functional

Border Outcome Feedback Actively Improves the System

Movu Works Reliably in Low-Bandwidth, Real-World Conditions

Core Trade Logic Is Fully Executable

The platform is fully functional covering;

- HS classification confidence
- AfCFTA Rules of Origin eligibility
- Corridor-specific export requirements
- Covering 3 - 6 corridors

Ecosytem impact:

- SMEs get predictable outcomes
- Agents trust pre-validated shipments
- Regulators see consistent logic application

Workflow Orchestration Owns Pre-Border Execution

All SME shipments on core corridors move through a state-machine–driven workflow
The system enforces:

- task order
- responsibility assignment
- validation gates

Ecosystem impact:

- Fewer delays and rework
- Agents focus on complex cases, not paperwork
- Regulators receive cleaner declarations

Adding New Corridors Does Not Break the Platform

Movu can add new corridors by:

- updating rules
- configuring workflows
- connecting systems

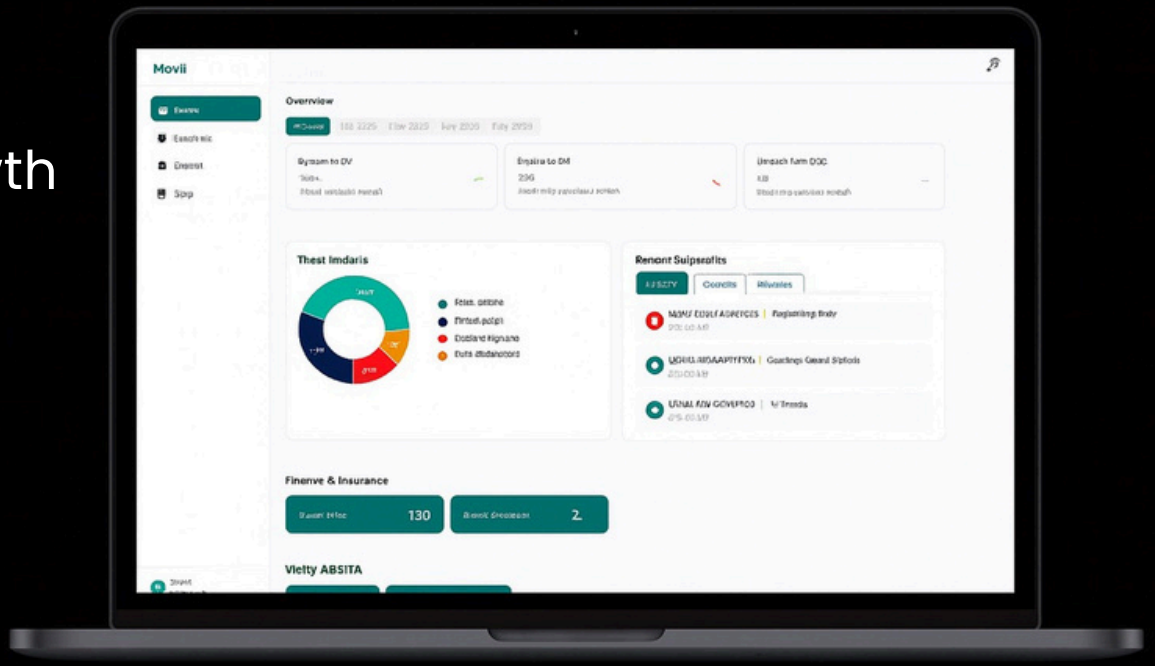
Ecosystem impact:

- The platform scales safely - avoiding services trap
- Technical debt stays controlled
- Growth is deliberate, not chaotic

movu

Business Model & Scale

- Asset-light, corridor-by-corridor growth
- Subscriptions + transaction fees
- Finance and insurance referrals
- API and data services



movu

The Roadmap & The Ask

Join me as technical co-founder to own system architecture, core platform decisions, and long-term technical direction as we build **Africa's trade execution layer**.
